Hand-Eye Coordination And Visual Discrimination Key To Literacy

By Deanna Mascle

Sometimes the best thing you can do for your child's early literacy development is simply to let them play. Turn off the TV and anything battery operated then let your child pick up their toys, build blocks or duplos, or manipulate puzzles or game pieces. Not only are you giving your child the gift of childhood, something we so often fail to do in today's hectic, achievement-oriented world, but you are actually helping them build skills that are key to learning to read and write.

Hand-eye coordination is a necessary skill for written language and the best way to help your child develop this skill is to let them play with toys and activities that involve looking at, using, and discriminating a number of elements. Puzzles are obviously a great activity for this but so are manipulative toys such as blocks, duplos, and magnetix.

My son just spent over an hour this evening playing dominos with his father -- OK they weren't so much playing as setting up complex patterns and then knocking them down -- but I didn't tell them they were engaged in a preliteracy activity. They were just having fun together.

Studies have shown that spending time on hand-eye coordination activities improves children's ability to learn to read and lessens the difficulty they face during the process. In fact engaging in a variety of craft activities, which most kids love, can be very beneficial so add play dough, stickers, and glue sticks to your list of educational supplies.

Research shows that early practice of hand-eye coordination activities reduces the risk for reading difficulties.

ACTIVITIES TO ENCOURAGE

Puzzles help develop hand-eye coordination because learning to control hands and fingers according to information received from sight is a coordination skill that aids children in early attempts at reading and writing. Determining out which piece goes where, working to fit pieces into place by making adjustments, and seeing a sequence develop in an organized pattern can be a great learning experience as well as very satisfying for children.

Puzzles, matching games, and the like are also important to help children learn visual discrimination.

Visual discrimination is the ability of the brain to quickly tell the difference among visually similar letters, like "p," "b," and "q" or between words such as "was" and "saw." Students with difficulty making these distinctions often struggle with learning to read, write, and spell. Playing games, engaging in activities, or with toys that help children discriminate among similar objects can be fun for the child and help them master an important preliteracy skill. My son loves to help his father sort change before rolling it to be deposited at the bank. Sure we could use an electronic sorter but our son loves to engage in the activity and it is a valuable learning experience for him.

Visual discrimination can often be learned with your child's existing toys. Matchbox cars, dolls, and action figures all offer the opportunity for your child to learn visual discrimination.

Encourage children to work their wrist and finger muscles as well as work on their coordination and small-motor skills to help prepare them for the handwriting practice in their future. Activities to help with these goals include legos and other building sets, playdough, puzzles, pegboards, beads and other table toys. These fun, natural activities help children improve their cognitive and fine motor skills without frustration or boredom.

My son engages in many activities every day that encourage hand-eye coordination and visual discrimination. I don't suggest the activities to him. I make the toys and manipulatives available to him and he chooses them on his own. The activities vary he may go an entire week building and rebuilding his wooden train set every day and then the next week his magnetix set dominates his play time. Some days he plays with both together and pulls in his duplos and wooden blocks for added fun. It doesn't matter to me which activity he chooses because I know he is having fun, challenging his imagination, and learning.

Toys Appropriate For One-Year-Old Children

By Nicole Munoz

From a fragile helpless little creature who could barely open his eyes, you've seen how your little kid bloomed to become the active, curious, and energetic one-year-old that he is right now.

Now is the time when he graduates from the rattles and baby squeaky toys that used to make him burst into a fit of giggles. Now is the time when he progresses to more advanced toys that will be suitable in developing his skills and stimulating his mental growth.

Toys for one-year-old children include:

Stacking toys that come in different shapes, sizes and colors. These toys which include stackable cups, pails, and rings are helpful in introducing your kid to a variety of shapes, sizes and colors. By learning how to stack up these toys his fine motor skills, hand to eye coordination, and spatial awareness are also being improved.

Unbreakable mirrors of assorted sizes. You might have noticed that your kid loves looking at that baby he sees whenever he's in your arms and you pass by a mirror. Toys like unbreakable mirrors are not only fun and enjoyable for your kid but will also allow for self-discovery which is important in his developmental progress.

Squeeze toys. These toys are good in improving your baby's grasp and release skills while the squeaky sounds that come from it will make your kid burst into laughter. Give your kid a variety of squeeze toys which can also be used in games like "where's the toy?" wherein you hide a toy and have your toddler look for it as his problem solving skills are being honed.

Cars, trucks and vehicle toys that do not have small or loose parts, sharp and pointy objects and are made of durable and flexible but safe plastic material.

Building toys such as large building blocks. Because your kid will be able to construct various creations from these toys, this is instrumental in honing his creativity and imagination.

Balls of various colors and sizes. Play baby soccer with your kid to improve his motor skills and eye to foot coordination by swinging him to kick these balls. Or use these balls to teach him about the round shape and the different sizes and colors and sharpen his visual discrimination.

Educational cardboard books with vibrant images and colourful prints. While your kid browses through these books, narrate to him and tell him about the things in the book, "this is a dog" or "this is a house." This will be beneficial in helping your kid's conceptual and language development.

Large dolls, plush toys or puppets. Babies are inherently enthusiastic about puppet shows. While these puppet shows are proven to keep baby amused and entertained, more importantly these will teach your kid about the art of conversation and encourage positive interaction. Have a Baby Einstein puppet talk to you and then respond. Talk about funny things or sings songs together.

Toys that mimic real-life gadgets and devices like toy telephones. Imitating older people is how a baby

learns about the world around him Use these toys to encourage imitative play and cultivate his social and language development.
